

Building FP Components

Nagamalleswararao Settineni

- The following are needed
 - SVN account
 - User account in kabira network
 - separate credentials to login into machines

Once login to the machine,

start vnc server

`/usr/bin/vncserver`

`echo $DISPLAY`

- Use **ktsp**rof file
 - param1 - username
 - param 2 - project
 - param 3 - vncserver
 - param4 - vnc number

The above creates **/opt/kabira/users/<username>/project**

- Use `importfpsrc.ksh`
- Downloads all components one by one
- Asks svn password for each component
 - Can be avoided if svn password is saved
 - Once component is checked out, softlinks are created

All files found under `/opt/kabira/user/<username>`

- Just checked out FP components
- In order to build components
 - TIBCO Kabira Builder, v3.6.5
 - FP is based on a core called KIS/KTP

- Alternatively,
 - If FP 3.9 is installed already, copy
tibco/fp/3.9/kis/distrib to the same directory where
is svn checked out

- For instance, to build msf component on *linux*
 - Go to `kpsamsf/msf/linux/src` directory
 - Run `dmake BUILD=ALL`
 - Build is available at
 - `/opt/kabira/users/<username>/BUILD`
- Same steps to build each component

Thank you
